

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

XLIV. *An Account of the Observations made upon the Transit of Venus over the Sun, 6th June 1761, at Cajaneburg in Sweden, by Monsf. Planman: Communicated in a Letter from Mr. Peter Wargentin, Secretary to the Royal Academy of Sciences in Sweden, and F. R. S. to Mr. John Ellicott, F. R. S. Translated from the French.*

Stockholm, October 30, 1761

Read Nov. 26, 1761. **I**N a letter, of the 7th of August, which I wrote to you, I communicated to you some observations on the late transit of Venus, made in Sweden, and, among these, that of Monsf. Planman, made at Cajanebourg. Since that time, some new observations have shewn, that the difference of meridians between Stockholm and Cajanebourg is only  $38' 40''$  to  $45''$ , that is, half a minute less than I presumed then. This correction has convinced Monsf. Planman, that, in his observation on the interior contact of the limbs of Venus and the sun, there has happened an error of a minute; not through the fault of the observer, but that of his assistant, who counted the seconds at the clock: so that, instead of  $10^h 8' 58''$ , it should be  $10^h 7' 58''$ . I think it extremely probable, that this is the fact; for, upon this correction, all the observations of Monsf. Planman agree very well with each other, and with those of the other astronomers.
